Learning styles, as they are currently defined, likely do not have a major effect on the way people learn. That's not to say people can't learn better with a different approach; it's just that the current "styles" aren't effective approaches. In the end, the way everything is taught remains relatively similar even if you change the method. A visual learner will still get the same information in the same order as someone who is an auditory learner. Someone might have a preference towards a certain style, but that doesn't mean they will learn better if they are only exposed to that style. They still have to be able to fully process that information. Personally, I learn better when I take in the material myself and break it down in a way that makes it understandable. That may require me to switch up the order I try to learn things, or expand further on certain aspects that I am unsure about. I end up using every "style" of learning by the time I finish learning something.
